Built Elements: Retaining Walls

Keeping the heritage of the North Texas prairie in mind, we have suggested an additional treatment of the panel surface of the retaining walls that represents the strata of the region revealed by the cutting of highways in the past. This scheme represents the flat layers of sandstone formed by the inland sea very near here. It is more realistic and easier to build than the curvilinear representation in Alternative D. This additional pattern, representing broken layers of flat sandstone evokes memories of highways near Dallas, cut into the hillside, exposing the subterranean qualities of the natural rock. This wall pattern could be used in conjunction with other wall designs, whether they are of intersecting highway projects or similar composite schemes within the LBJ Corridor.
